Department: I ECE FB

Batch: 2028

Degree: B.E - ECE

### NeoColab\_REC\_CS23231\_DATA STRUCTURES

REC\_DS using C\_Week 1\_COD\_Question 3

Attempt : 1 Total Mark : 10 Marks Obtained : 10

Section 1: Coding

#### 1. Problem Statement

Imagine you are working on a text processing tool and need to implement a feature that allows users to insert characters at a specific position.

Implement a program that takes user inputs to create a singly linked list of characters and inserts a new character after a given index in the list.

## **Input Format**

The first line of input consists of an integer N, representing the number of characters in the linked list.

The second line consists of a sequence of N characters, representing the linked list.

The third line consists of an integer index, representing the index(0-based) after

which the new character node needs to be inserted.

The fourth line consists of a character value representing the character to be inserted after the given index.

### **Output Format**

If the provided index is out of bounds (larger than the list size):

- 1. The first line of output prints "Invalid index".
- 2. The second line prints "Updated list: " followed by the unchanged linked list values.

Otherwise, the output prints "Updated list: " followed by the updated linked list after inserting the new character after the given index.

Refer to the sample output for formatting specifications.

### Sample Test Case

```
Input: 5
a b c d e
2
X
Output: Updated list: a b c X d e

Answer

// You are using GCC
#include<stdio.h>
#include<stdlib.h>

typedef struct Char{
    char value;
    struct Char* next;
}Node;

Node* newnode(char value) {
    Node* new_node = (Node*) malloc(sizeof(Node) new_node->value = value;
```

```
240801198
                                                   240801108
return new_node;
      new_node->next = NULL;
    void insertNode(Node** head, char value) {
      Node* temp = *head;
      if(temp == NULL) {
        *head = newnode(value);
        return;
      while(temp->next !=NULL) {
        temp = temp->next;
      temp->next = newnode(value);
    int length(Node* head) {
      int len = 0:
      while(head != NULL) {
        head = head->next:
        len++;
      }
      return len;
    }
    void traverse(Node* head) {
                                                   240801198
      while(head != NULL) {
        printf("%c ", head->value);
        head = head->next;
      printf("\n");
    void insert(Node**head, int pos, char value){
      if(pos>=length(*head)){
        printf("Invalid index\n");
        return;
      }
      Node*temp=*head;
                                                                             240801198
                                                   240801198
temp=temp->next;
      for(int i=0;i<pos;i++){</pre>
```

```
new_node =newnode(v
new_node->next=temp->next;
temp->next=new_node
}
                                                                                    240801198
                                                        240801198
       Node* new_node = newnode(value);
     int main(){
       int n:
       char value;
       Node* head = NULL;
       scanf("%d", & n);
       for(int i=0;i<=n;i++){
          scanf("%c ", &value);
                                                                                     240801798
                                                        240801108
        if(value == ' | || value == '\n'){
            continue;
          insertNode(&head, value);
       scanf("%d %c", &n, &value);
       insert(&head, n, value);
       printf("Updated list: ");
       traverse(head);
     }
     Status: Correct
                                                                             Marks: 10/10
